```
A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TbRa35. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen,
                                                                                                                                                      Aaw32354 Mycobacte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New immunogenic polypeptide(s) from soluble M. tuberculosis antigens useful for diagnosis of M. tuberculosis infection.
                                                                                                                                                                                                                                                                                     Antigen; immunogen; vaccine; tuberculosis; non specific adjuvant; skin testing; M.tuberculosis.

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tubarculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TDRa35. The immunogenic protein, and fusion proteins containing one or more of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW64307;
```

```
This polypeptide comprises Mycobacterium tuberculosis soluble antigen TDRa35. It is encoded by a DNA sequence (see AA444355) isolated from a M. tuberculosis strain H37Ra expression library with rabbit anti-sera raised against M. tuberculosis supernatar. No significant homology was found between TDRa35 and Genebank database sequences. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM64291-W64379) compositions and methods for diagnosing tuberculosis. It provides soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above colypeptides, antibodies or oligonacleotide probes and primers, for the diagnosis of tuberculosis. (Updated on 17-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                QASDSLIGAEETINGLIQFDAAIQPGDSGGPVVNGLGQVVGMNTAASDNFQLSQGGGFA 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MSNSRRRSLRWSWLLSVLAAVGLGLATAPAQAAPPALSQDRFADFPALPLDPSAMVAQVA 60
                                                                                                                                                                                                                                                                             This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MSNSRRRSIEWSWLLSVLAAVGLGLATAPAQAAPPALSQDRFADFPALPLDBSAWVAQVA

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M tuberculosis Ag's. M tuberculosis Ag's. My take encoding them, derived fusion proteins and other by decinings to generate a protective or therapeutical compositions or tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AZ1949 to AAZ19460 and AAX39083 to AAY39225 are used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       181 QASDSLTGAEETLNGLIQFDAAIQPGDSGGPVVNGLGQVVGMNTAASDNFQLSQGGQGFA 240

```

The sequence represents Mycobacterium tuberculosis TDRa35 (also known as Mtb32A), an M. tuberculosis antigen. Compositions comprising at least 2 feterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease frequently affecting patients with acquired immunodeficiency disease, AIDS

New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymerication sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polypeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are wiseful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis WTB32A antigenic protien. WTB32A is also referred to as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

Weobacterium species antigens, uncleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with the serological sensitivity of sera from individuals infected with the serological sensitivity of sera from individuals infected with treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune nesponse in a mammal, e.g., human, prevention of Mycobacterium infection. The fusion proteins and the polynucleotides are useful as diagnostic tools in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral mycobacterium, in vitro and in vivo assays for detecting humoral infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a immunogens to generate or elicit a protective immune response in a naminal. Sequences of the invention are useful as in vivo diagnostic agents for for intradermal skin test. The present sequence is Mycobacterium species manal manal skin test. The present sequence is Mycobacterium species

The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection

Skeiky Y, Guderian J;

WPI; 2001-266299/27. N-PSDB; AAL40768 Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.

Disclosure; Fig 1; 39pp; English

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polymuclectide sequence of Ral2, a 14 kDa C-terminal fragment of serine protease antigen MTB32A of Mycobacterium tuberculosis, and a heterologous polymuclectide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum

antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This sequence represents the Mycobacterium tuberculosis MTB32A protein

```
Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated
                                                                                                                                                                                                                                                                            Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QASDSLTGAEETLNGLIQFDAAIQPGDSGGPVVNGLGQVVGMNTAASDNFQLSQGGQGFA 264

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AdHS1947 - AAHS2092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a recombinant nucleic acid molecule encoding a bull this involve periode. The recombinant nucleic acid comprises a hererologous polymenclectide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and Leishmania polymucleotide sequence encoding a polymeticleotide sequence encoding a polymeticleotide or the fragment. The Leishmania polymucleotide is selected from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are wiscful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis mature Ra35 (N-terminus of MTB32A, RA35FL) antigenic protein
                                                                                                                                                                                                                                                                                                                            New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        248 GVVDNNGNGARVQRVVGSAPAASLGISTGDVITAVDGAPINSATAMADALNGHHPGDVIS 307

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammal, e.g., human, consention of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium infection. The fusion proteins and the attibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human continual sequences of the invention are also used as vaccines. MTB32A fusion proteins skin test. The present sequence is Mycobacterium species mTB32A (MTB32A) (MTB32A) mature protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Sylvetical protein 34K - Mycobacterium paratuberculosis
C;Species: Mycobacterium paratuberculosis
C;Species: Mycobacterium paratuberculosis
C;Accession: 847170
S;Cybate: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 09-Dec-2002
C;Accession: 8.47170
S;Cybate: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 09-Dec-2002
S;Cybaterion: 8.47170
S;Cybaterion: Isolation and characterisation of a 34KDa protein of Mycobacterium paratumy
S;Reference number: 847170
S;Status: preliminary
S;Rolession: 847170
S;Status: DNA
S;Residues: 1-361 <CAM
S;Residues: 1-361 <CAM

Serine proteinase [imported] - Nostoc sp. (strain PCC 7120)
C,Species: Nostoc sp. PCC 7120
A,Note: Nostoc sp. strain PCC 7120
C,Note: Nostoc sp. strain PCC 7120
C,Note: Nostoc sp. strain PCC 7120
C,Accession: AB2057
R,Kaneko, T.; Nakamura, Y.; Wolk, C.P.; Kuritz, T.; Sasamoto, S.; Watanabe, A.; Iriguchi, Nakazaki, Shimpo, S.; Sugimoto, M.; Takazawa, M.; Yamada, M.; Yasuda, M.; Tabata, S. NA Res. B, 205-213, 2001
A,Title: Complete Genomic Sequence of the Filamentous Nitrogen-fixing Cyanobacterium Anak A,Reference number: AB1807; MUID:21595285; PMID:11759840
A,Status: preliminary
A;Title: Complete Genomic Sequence of the Filamentous Nitrogen-fixing Cyanobacterium Anal

INVOLVED IN THE DEGRADATION OF DAMAGED PROTEINS. SHARED SPECIFICITY WITH HHOA/DEGQ.
-!- SUBCELLULAR LOCATION: Periplasmic.

Anovel two-component regulatory system in Bacillus subtilis for the Navel two-component regulatory system in Bacillus subtilis for the Stream in Secretion stress.";

Mol. Microbiol. 41:1159-1172(2001).

L. FUNCTION: May be involved in processing, maturation, or secretion of extracellular enzymes.

C. INDUCTION: Transcription is cass dependent. Induced by heat shock during exponential growth and by heterologous amylases at the transition phase of the growth cycle. Negatively regulates its own transition phase of the growth and during heat shock.

C. INTSCLIANGEOUS: Inactivation results in compensating overexpression of ytvh, especially during stress conditions.

C. INTSCLIANGEOUS: Inactivation results in compensating overexpression of ytvh, especially during stress conditions.

C. INTSCLIANGEOUS: INDUCTION: DESCRIPTIONS.

C. INTSCLIANGEOUS: INACTIVATION STRESS CONDITIONS.

C. INTSCLIANGEOUS: INACTIVATION PROPERTY COMPANIENTY: Contains I PDZ/PHR domain.
